# Understanding Short- and Medium Range Order in Materials Using Total Scattering

Thomas Proffen

[tproffen@lanl.gov](mailto:tproffen@lanl.gov)

LA-UR 05-1010

LA-UR 06-6075

Operated by the Los Alamos National Security, LLC for the DOE/NNSA

UNCLASSIFIED

# The challenge of *real* materials

- Traditional crystallographic approach to structure determination is insufficient or fails for
  - Non crystalline materials
  - Disordered materials: The interesting properties are often governed by the defects or local structure !
  - Nanostructures: Well defined local structure, but long-range order limited to few nanometers (-> badly defined Bragg peaks)
- An approach to determine local and nano-scale structures is needed.

Nanostructures: *Science* (290) 2000

# Total scattering ?

Cross section of 50x50x50 u.c. model crystal consisting of 70% black atoms and 30% *vacancies* !  
**Properties might depend on vacancy ordering !!**

UNCLASSIFIED

## How about powder diffraction ?

UNCLASSIFIED

# Finally the Pair Distribution Function (PDF)

The PDF is the **Fourier transform** of the **total scattering** diffraction pattern !

Proffen, Z. Krist, **215**, 661 (2000)

# What is a PDF?

**Example:**  
C<sub>60</sub> - 'Bucky balls'

The PDF (similar to the Patterson) is obtained via Fourier transform of the **normalized total scattering**  $S(Q)$ :

$$G(r) = \frac{2}{\pi} \int_0^{\infty} Q[S(Q) - 1] \sin(Qr) dQ$$

$$Q = 4\pi \sin \theta / \lambda$$

UNCLASSIFIED

---

# Instruments

UNCLASSIFIED

Operated by the Los Alamos National Security, LLC for the DOE/NSA

U Virginia – November 2007

# What is required to obtain high quality PDFs ?

The PDF (similar to the Patterson) is obtained via Fourier transform of the **normalized total scattering**  $S(Q)$ :

$$G(r) = \frac{2}{\pi} \int_0^{\infty} Q [S(Q) - 1] \sin(Qr) dQ$$

## Requirements to obtain 'good' PDF:

- High maximum momentum transfer,  $Q_{\max}$ .
- High Q-resolution.
- Good counting statistics @ high Q.
- Low instrument background

## Where ?

**Synchrotron sources**  
(high energy X-rays)

or

**spallation neutron sources**  
(reactor neutron energies are too low)

# What makes a good PDF: Influence of $Q_{\max}$ ...

Termination of integral at  $Q_{\max}$  results in convolution of  $G(r)$  with  $\sin(Q_{\max} r)/r$ .

ZnSe<sub>0.5</sub>Te<sub>0.5</sub> data collected on GEM terminated at **40 Å<sup>-1</sup>** and **17 Å<sup>-1</sup>**  
 NN split unresolved at 17 Å<sup>-1</sup> !

# What makes a good PDF: Influence of Q resolution ...

Comparison of measurements of Nickel powder on instruments GLAD at IPNS and NPD at MLNSC.

PDF goes  
"Nano"

High Q resolution: Large  $r$  range (PDF dampened by  $\exp -(r\Delta Q)^2/2$ )

# NPDF: Overview

## Specifications

- Upgrade finished Sep. 2002
- L1: 32m,  $Q_{\max}=50\text{\AA}^{-1}$ ,  $\Delta d/d=0.15\%$
- Typical PDF measurement 1 - 4 hrs
- Sample amounts down to 200 mg
- Ancillary: 10K-1500K, soon: 0.5K, 11T

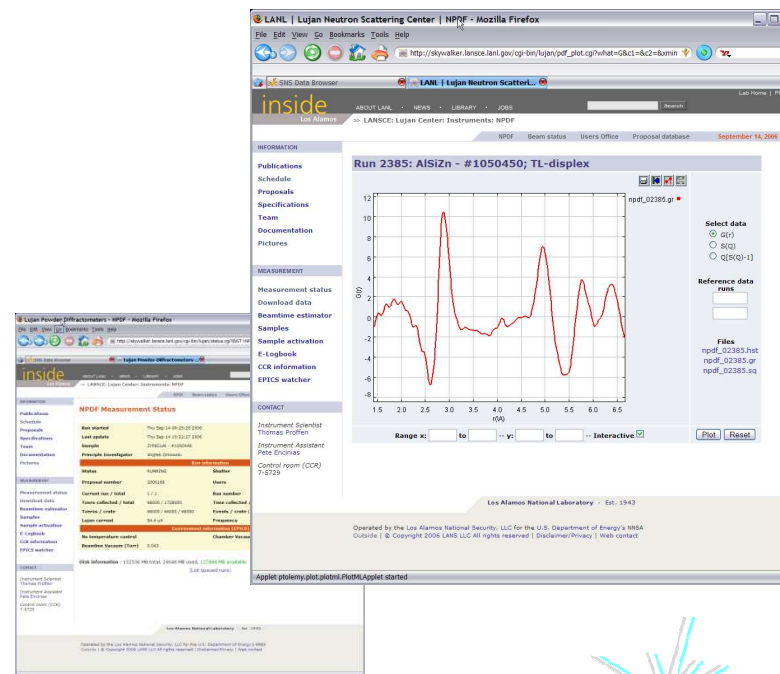

## Science

- 95% PDF studies, hard matter
- Many users *new* to PDF
- Oversubscription in 2006: ~1.6

## Software

- Web based instrument interface
- Automatic creation of PDF
- Integration in SNS data portal (soon)

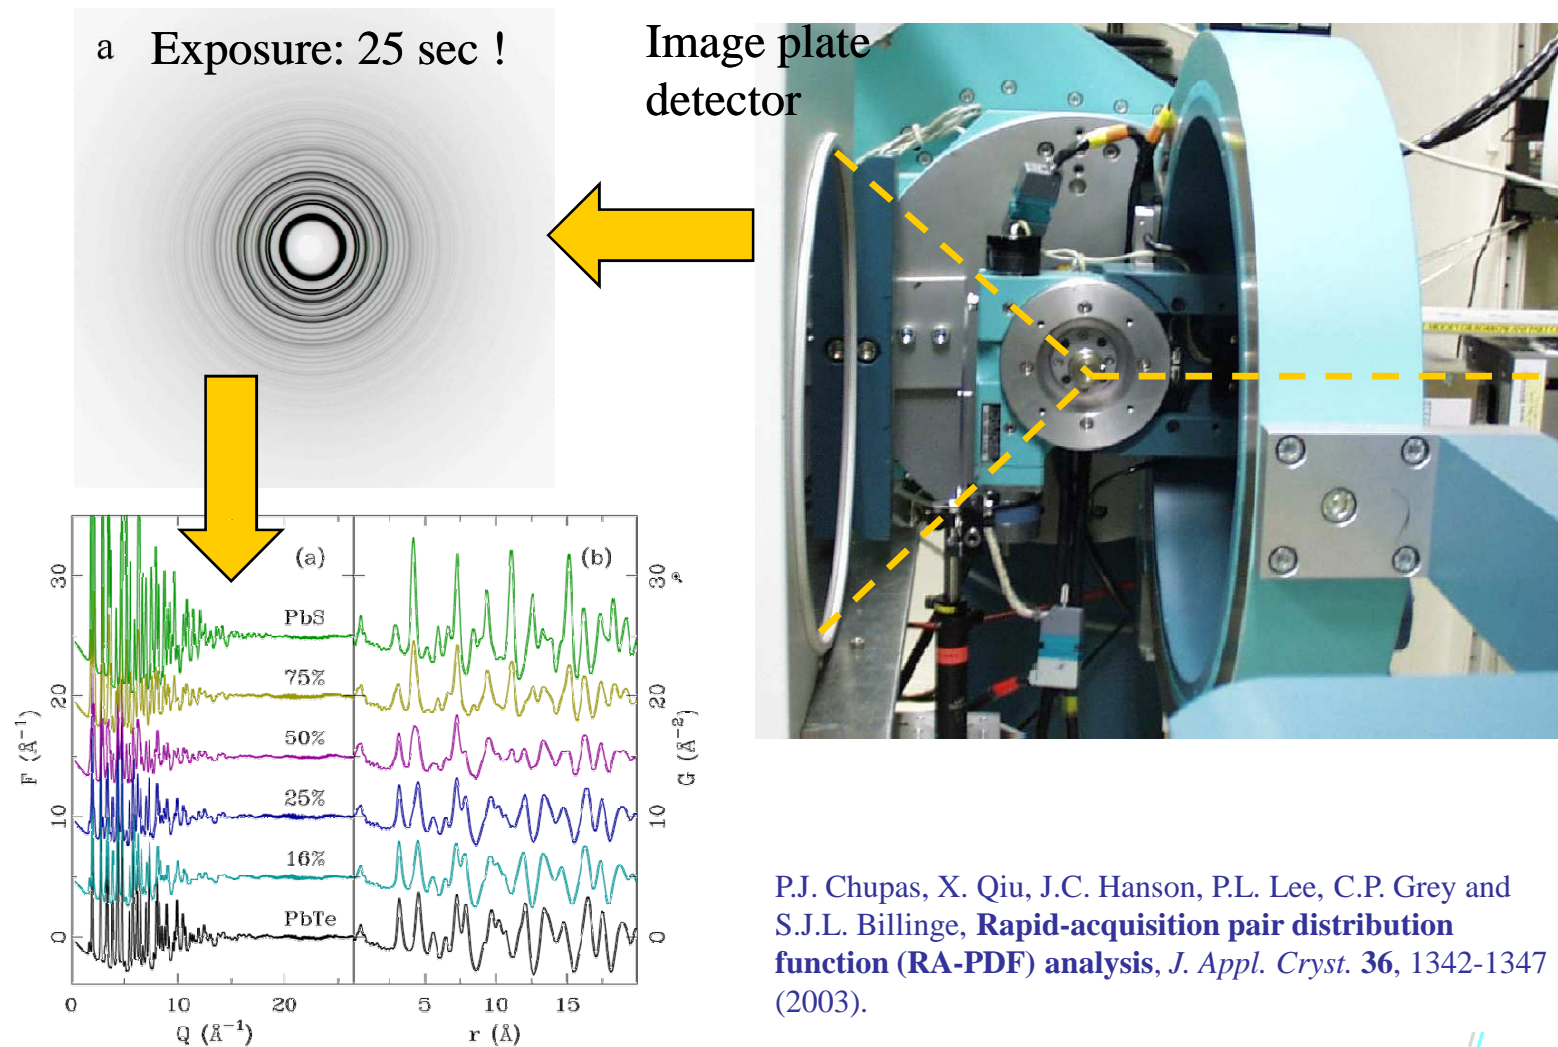

UNCLASSIFIED

## Upgrade project NPDF (PI: Takeshi Egami)

# X-ray PDF: The fast way

P.J. Chupas, X. Qiu, J.C. Hanson, P.L. Lee, C.P. Grey and S.J.L. Billinge, **Rapid-acquisition pair distribution function (RA-PDF) analysis**, *J. Appl. Cryst.* **36**, 1342-1347 (2003).

UNCLASSIFIED

# X-ray PDF: In house measurements

*fci-Ho-Mg-Zn*

2/1-model for *fci-Ho*<sub>9</sub>*Mg*<sub>26</sub>*Zn*<sub>64</sub>  
R=12.9%

Huber Gunier diffractometer  
 $Q_{\max} = 13.5 \text{ \AA}^{-1}$

# Modeling and Software

UNCLASSIFIED

Operated by the Los Alamos National Security, LLC for the DOE/NSA

U Virginia – November 2007

# Outline

---

- What to do with your PDF ?
- Give it to your favorite theorist.
- Try 'experimentalists' modeling on a structural model
  - A new parameter –  $r$
  - Small models: Least square refinements
  - Large models: Reverse Monte Carlo
  - Any model: Evolutionary Algorithms

## Refinement range – length scales in structure

- Simulated structure of 20x20x20 unit cells.
- Matrix (M): blue atoms
- Domains (D): red atoms, spherical shape,  $d=15\text{\AA}$ .
- Simulated using DISCUS.

Th. Proffen and K.L. Page, **Obtaining Structural Information from the Atomic Pair Distribution Function**, *Z. Krist.* **219**, 130-135 (2004).

# Refinement range – length scales in structure

- *Top:* Single-phase model with blue/red fractional occupancies (○).
- *Bottom:* Refinement of same model for 5Å wide sections.
- Extensions:
  - Multi phase models
  - Modeling of boundary
  - R-dependent refinable mixing parameters

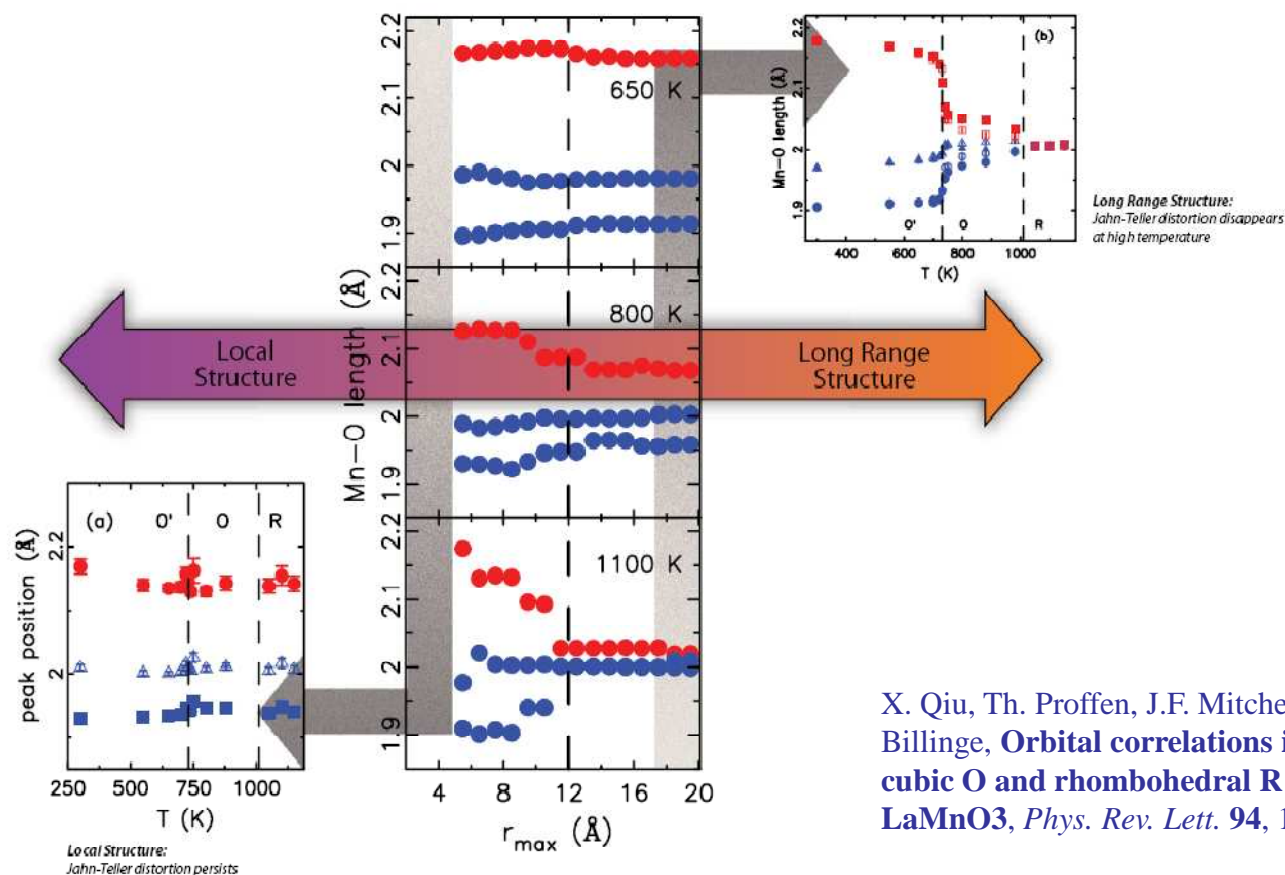

UNCLASSIFIED

# Refinement range – the mystery of $\text{LaMnO}_3$

## DISTORTED OR NOT DISTORTED?

Study of the Jahn-Teller distortion in  $\text{LaMnO}_3$

X. Qiu, Th. Proffen, J.F. Mitchell and S.J.L. Billinge, **Orbital correlations in the pseudo-cubic O and rhombohedral R phases of  $\text{LaMnO}_3$** , *Phys. Rev. Lett.* **94**, 177203 (2005).

UNCLASSIFIED

---

# PDFfit

## Refining a small structural model to the PDF

UNCLASSIFIED

# PDFfit: Refinement of a small structural model

- “Real space Rietveld”
- Refinement of structural parameters: *lattice parameters, atom positions, occupancies, adp's, ..*
- Small models (<200 atoms).
- Corrections for  $Q_{max}$ , *instrument resolution, correlated motion.*
- Software: *PDFfit, PDFfit2 and PDFGui.*

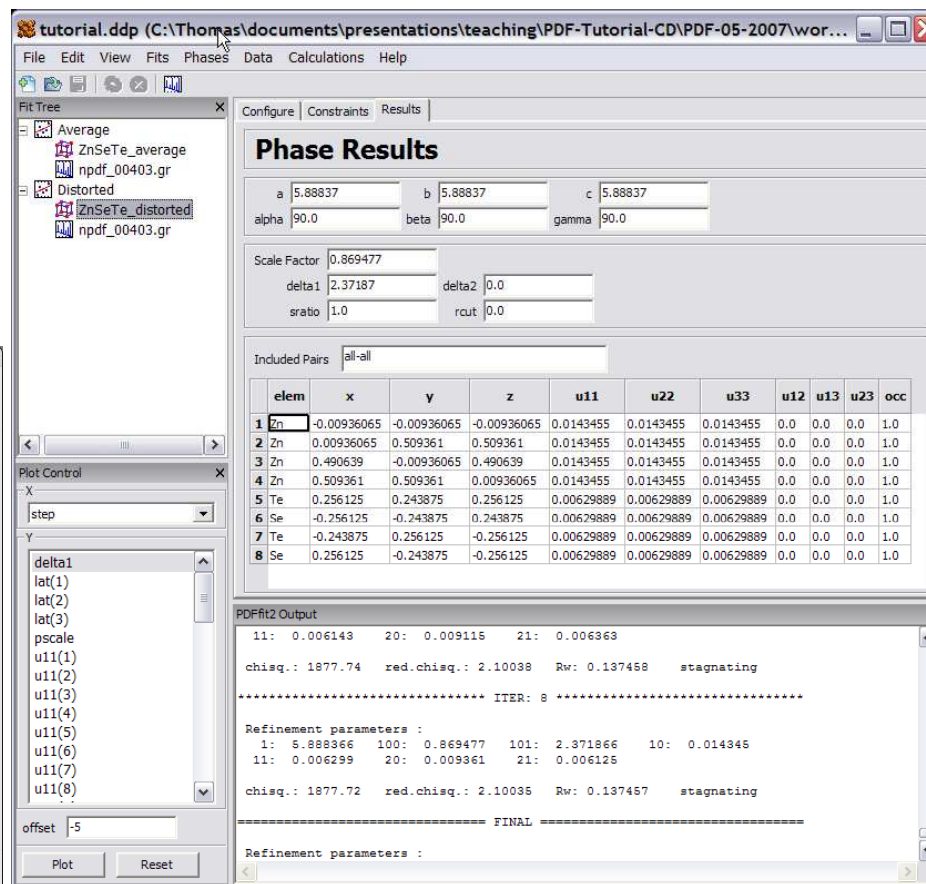

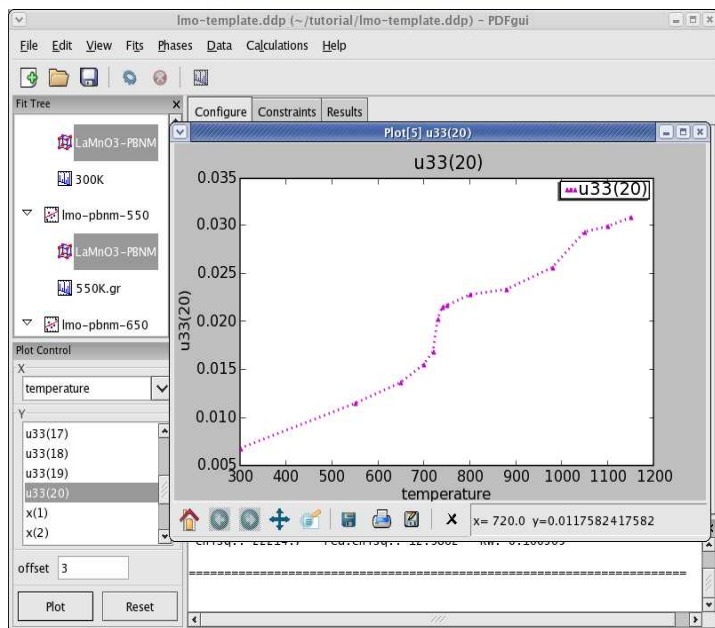

Example: Is sandstone simply quartz ?

K.L. Page, Th. Proffen, S.E. McLain, T.W. Darling and J.A. TenCate, **Local Atomic Structure of Fontainebleau Sandstone: Evidence for an Amorphous Phase ?**, *Geophys. Res. Lett.* **31**, L24606 (2004).

UNCLASSIFIED

# PDFgui – looks cool ..

<http://www.diffpy.org>

UNCLASSIFIED

---

# RMC

## Shaking a big box of atoms.

*Courtesy of M. Tucker,  
ISIS*

UNCLASSIFIED

Operated by the Los Alamos National Security, LLC for the DOE/NSA

U Virginia – November 2007

## Reverse Monte Carlo

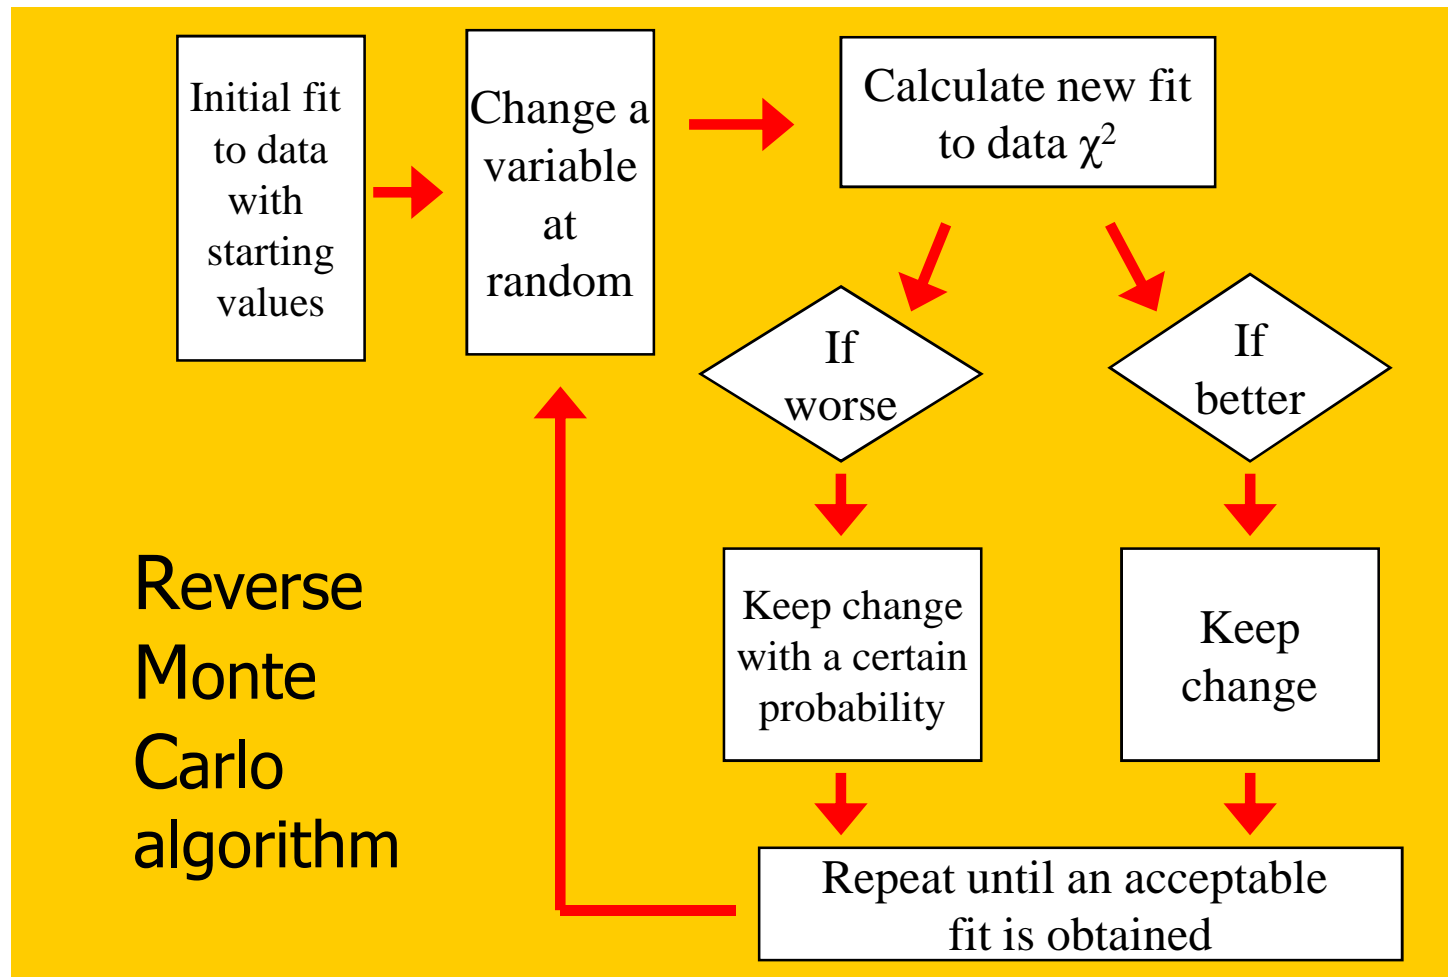

---

- Commonly used to model glasses and liquids (no long range order).
- Recently applied to disordered crystalline materials.
- Large model structures.
- Importance of constraints.
- Uniqueness of solution ?

R.L. McGreevy and L. Pusztai, **Reverse Monte Carlo Simulation: a New Technique for the Determination of Disordered Structures** , *Mol. Simul.* **1**, 359-367 (1988).

M.G. Tucker, M.T. Dove and D.A. Keen, **Application of the Reverse Monte Carlo Method to Crystalline Materials** , *J. Appl. Cryst.* **34**, 630-638 (2001).

## RMC: How does it work ?

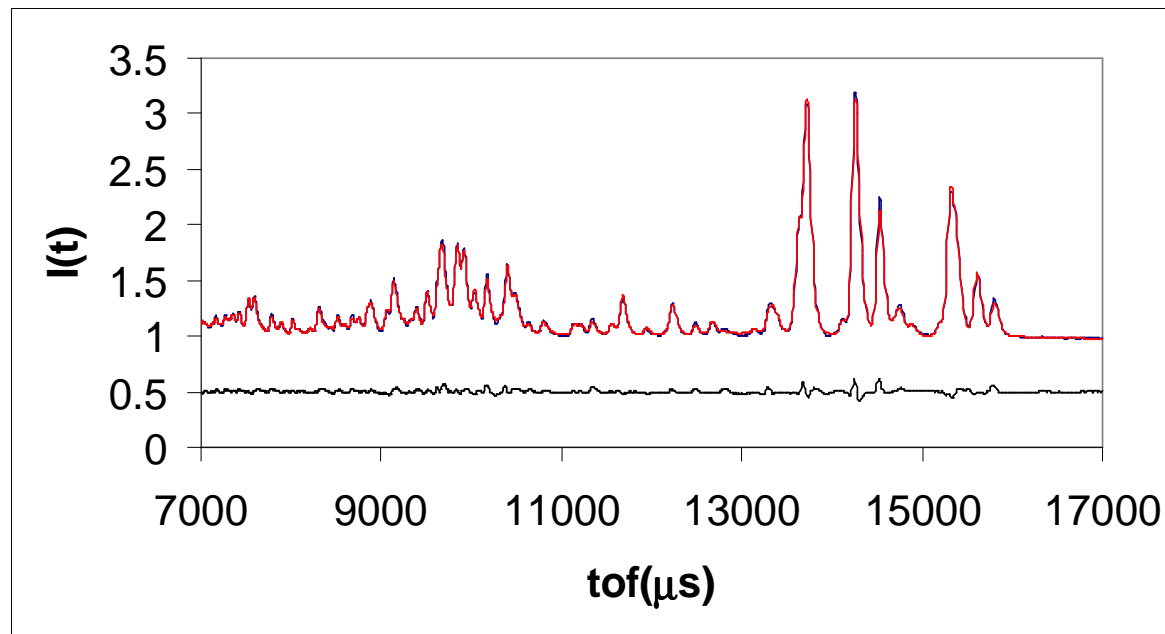

## Include Bragg intensities ..

Use GSAS to fit :  
Peak shape  
Background  
Lattice parameters

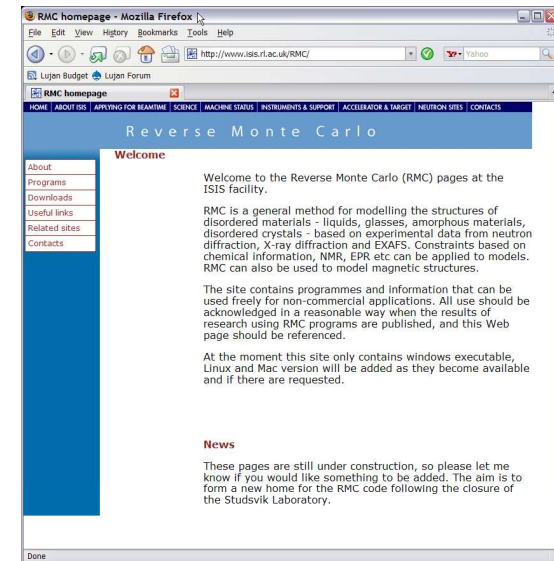

RMCPProfile calculates the intensities and then produces the profile.

$$+ \sum_j |I_{\text{expt}}(t_j) - sI_{\text{calc}}(t_j)|^2 / \sigma_{I(t_j)}^2$$

# Software: RMCprofile and DISCUS

- RMCprofile
  - Atomic configurations ~600 to 20000+ atoms
  - Fit both X-ray and neutron  $F(Q)$
  - Fit  $G(r)$
  - Fit Bragg profile (GSAS tof 1,2 & 3)
  - Polyhedral restraints
  - Coordination constraints
  - Closest approach constraints
- Produce a static 3-D model of the structure (a snap-shot in time)
- Link: <http://www.isis.rl.ac.uk/RMC>

# DIFFEV

## Refining parameters of a disordered particle/crystal

*Courtesy of R.B. Neder,  
U Würzburg*

## DIFFEV: Refining model parameters

- PDFfit and RMC
  - Refine structure directly in terms of atom coordinates etc ..
  - Difficult for complex systems
- Alternative
  - Refine parameters of a structural model and not each atom.
  - Example nanoparticle: *diameter, atom spacing, stacking fault probability, ...*
  - Choose minimization – here DIFFEV

## Example: ZnSe nanoparticles - Model

$\{110\}$  and  $\{001\}$

create a large single Wurtzite layer A/B

Stack along c (with faults)

Cut to proper size

Calculate PDF / powder pattern

Repeat and average

Repeat with new set of parameter  
using a Differential Evolutionary Scheme

Software: DISCUS and DIFFEV

# Example: ZnSe nanoparticles - Results

- Results:
  - $a=3.973\text{\AA}$ ,  $c=6.494\text{\AA}$
  - Diameter  $\sim 26\text{\AA}$
  - Stacking fault prob. 70%

C. Kumpf, R.B. Neder et al., **Structure determination of CdS and ZnS nanoparticles: Direct modeling of synchrotron-radiation diffraction data**, *J. Chem. Phys.* **123**, 224707 (2005).

— exp  
— calc

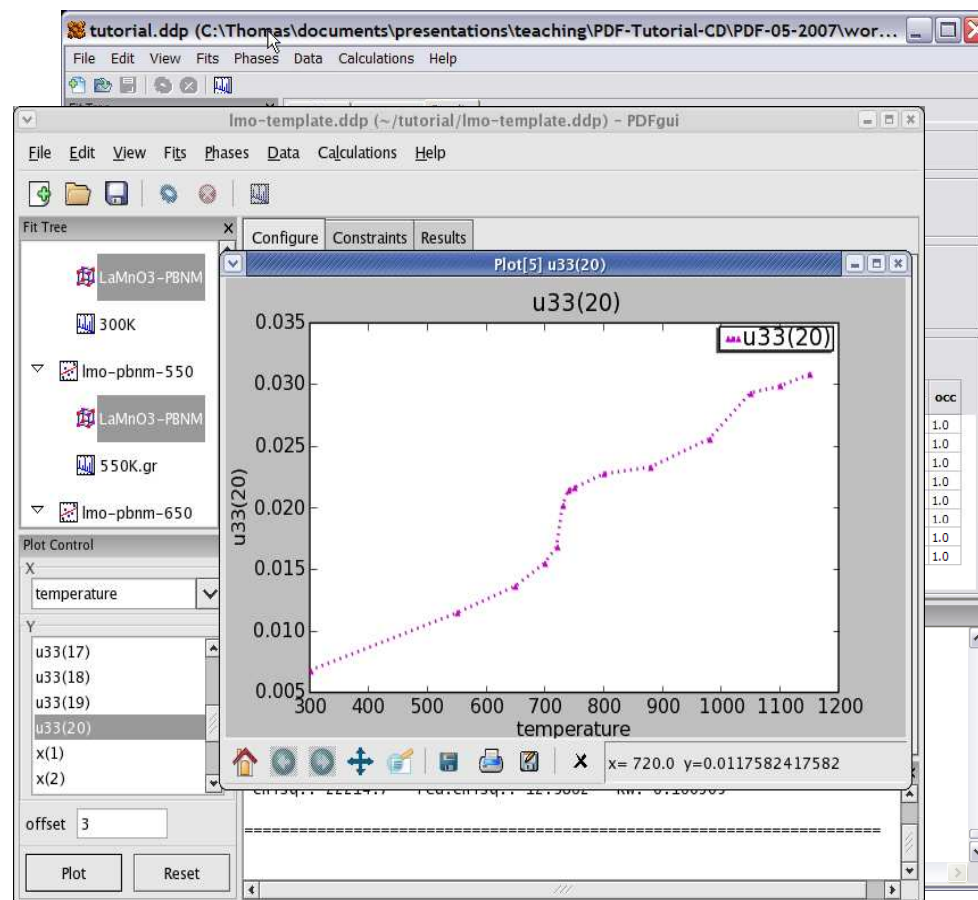

## How to model PDF data ?

---

- Single peak fitting
  - PDF peak position / widths as function of T,x,P,..
  - PDF peak widths as function of r  $\Rightarrow$  correlated motion, ..
- Modeling based on structural model
  - Comparison to average crystal structure
  - **DISCUS**: Large model systems, using e.g. RMC
  - **PDFFIT**: 'Real space Rietveld' (few unit cells)
- Compare to theoretical predictions
  - let the theorist do the work ..

## Challenge software – exciting developments ..

- PDFFIT2 and PDFgui
- Part of the DANSE project.
- Diffraction headed by Simon Billinge (MSU)
- NSF award of ~\$12M.

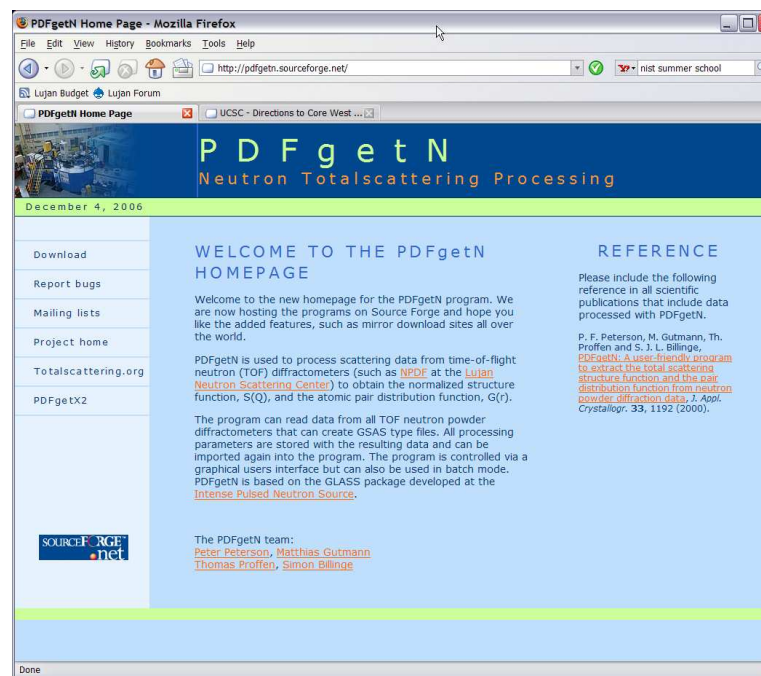

<http://www.diffpy.org>

# The DISCUS cook book – coming soon !

- To be published by Oxford University Press as IUCr text.
- Includes CDROM with many examples.
- Summer 2008

sorting process uses shifting of individual atoms as well as switching of randomly picked pairs, lines 35 and 36. Such a sorting process does not try to mimic the actual diffusion within a crystal, but just tries to create the indented result efficiently.

Notice, that the shifting of the pseudo atoms allows these to assume any fractional position within the host metric. In the final structure all atoms, the host and domain atoms shall occupy the position (0,0,0). To achieve this, all pseudo atoms are shifted to the next integer lattice point after the sorting has finished. After the sorting process the structure will look like in Fig. 8.7, which shows a section of the total crystal. Finally, the sorted arrangement of domains is used by the macro called 'dom.spheres.replace.mac' to replace part of the atoms within the host crystal by the domain structures. This step is essentially identical to the corresponding step in previous examples. After defining the input mode to pseudo (line 6) and naming the input file *dom.sph.domains.list* (line 7), the parameters for the two domains are defined. Each domain character is defined as a spherical domain (lines 8 and 18), yet still a minimum distance to the atoms in the original crystal is defined via *assign fuzzy*, AA, 2.0 (lines 9 and 19). The radius of the two domain types is given by expanding the shape matrix by a factor of 2.4 and 1.4, respectively. After the replacement, the structure looks like Figure 8.4. The spherical domains are placed at average distances throughout the original structure. Remember that no angular correlation was introduced. The Fourier transform of the final structure shows intense ring shaped diffuse scattering around each Bragg reflection. This diffuse scattering is due to the fact that the difference between the host and the domains is just the ordering of equal atoms into respective domains. Such a short range order between atoms of equal type will give diffuse scattering in the vicinity around each Bragg reflection. The Fourier transform of the domain distribution is multiplied with the

# Examples

UNCLASSIFIED

Operated by the Los Alamos National Security, LLC for the DOE/NSA

U Virginia – November 2007

# Local atomic strain in $\text{ZnSe}_{1-x}\text{Te}_x$

**Simon Billinge**  
**Thomas Proffen (LANL)**  
**Peter Peterson (SNS)**

**Facilities:** IPNS, Lujan  
**Funding:** DOE, NSF

UNCLASSIFIED

## $\text{ZnSe}_{1-x}\text{Te}_x$ : Structure

- Zinc blend structure (F43m)
- **Technological important** :  
Electronic band gap can be tuned by the composition  $x$ .
- Bond length difference  $\text{Zn-Se}$  and  $\text{Zn-Te} \Rightarrow$  **strain**.
- Local structural probe required !

# ZnSe<sub>1-x</sub>Te<sub>x</sub> : Total scattering

Peterson et al., *Phys. Rev. B* **63**, 165211 (2001)

# ZnSe<sub>1-x</sub>Te<sub>x</sub> : Nearest neighbors and Z-plots ..

BLUE: XAFS from Boyce et al., *J. Cryst. Growth.* **98**, 37 (1989); RED: PDF results.

# Local structure of $\text{WS}_2$

**Simon Billinge**  
**Thomas Proffen (LANL)**  
**Peter Peterson (SNS)**  
**Valeri Petkov (CMU)**

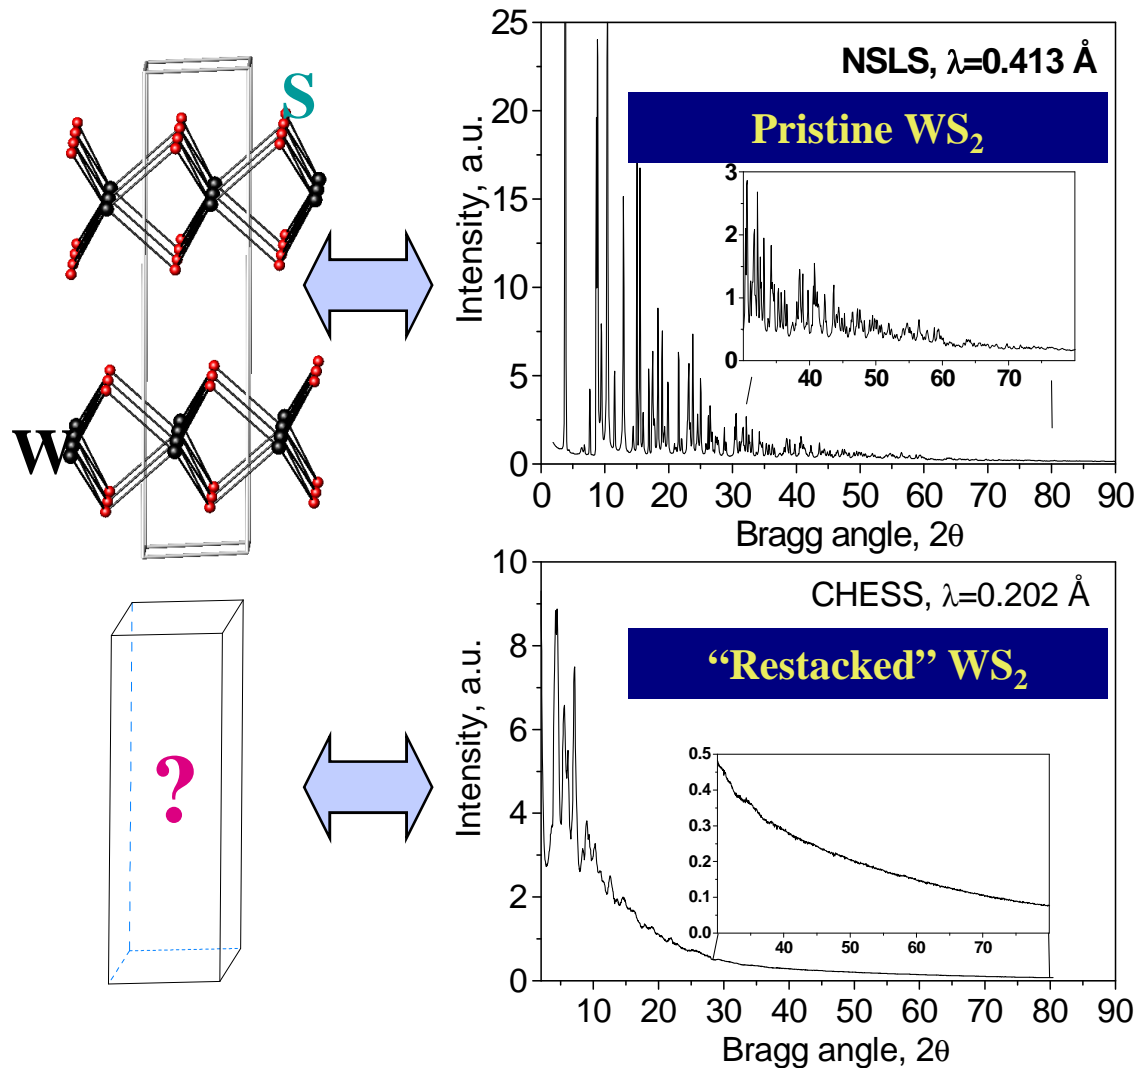

**Facilities:** Chess  
**Funding:** DOE, NSF

UNCLASSIFIED

## WS<sub>2</sub> : Structure of the “restacked” material

- WS<sub>2</sub> useful as a lubricant, catalyst, solid-state electrolyte.

- Exfoliated and restacked WS<sub>2</sub> has a metastable disordered structure.

Disorder precluded a full structural solution

# WS<sub>2</sub> : PDF to the rescue

**Pristine WS<sub>2</sub>:**

Hexagonal  
P6<sub>3</sub>/mmc

**“Restacked” WS<sub>2</sub>:**

Monoclinic  
P112<sub>1</sub>  
(disordered derivative of WTe<sub>2</sub>)

# Jahn Teller Distortion in $\text{LaMnO}_3$

Simon Billinge  
Emil Bozin  
Xiangyn Qiu

Thomas Proffen

**Facilities:** Lujan  
**Funding:** DOE, NSF

UNCLASSIFIED

## LaMnO<sub>3</sub> : Local structure vs. electronic state

- JT orbitals are ordered at low-temperature in a checker-board pattern:

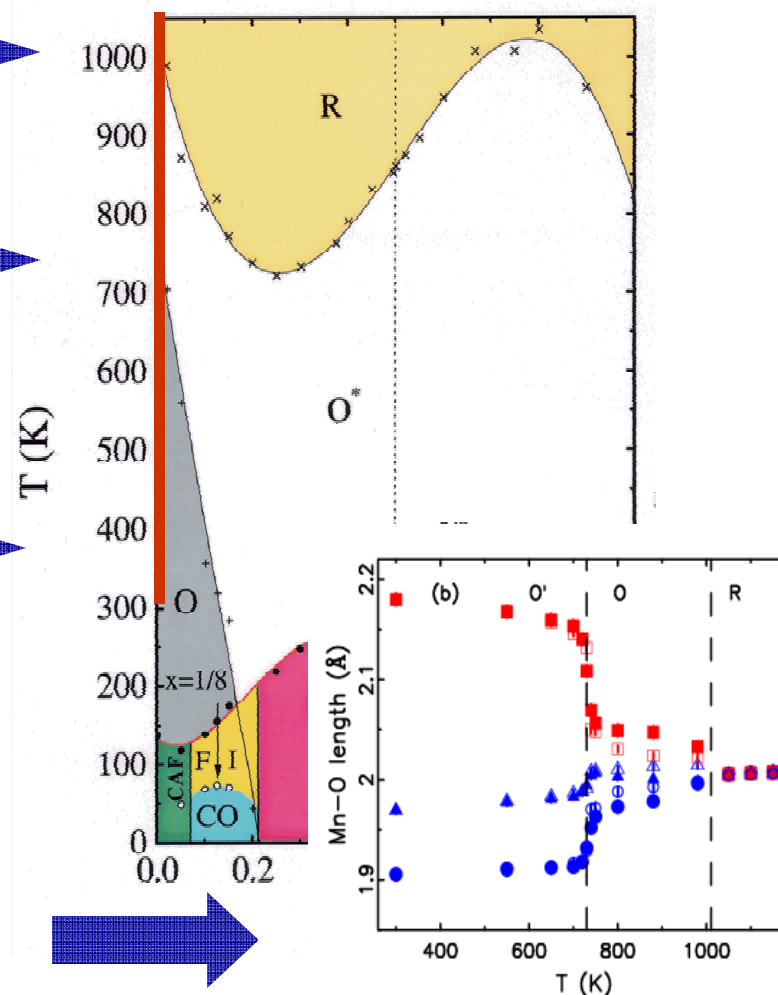

# LaMnO<sub>3</sub> : Crystallography

Rhombohedral  
No JT distortion

Less-Orthorhombic-O'  
Virtually no JT distortion

Orthorhombic-O  
Large JT distortion

JT distortion disappears at  
the O-O' transition

# LaMnO<sub>3</sub>: Jahn-Teller distortion

Local structure

Average structure

- Mn-O bond lengths are invariant with temperature, right up into the R-phase
- JT distortions persist locally in the pseudocubic phase
- Agrees with XAFS result: M. C. Sanchez et al., PRL (2003).

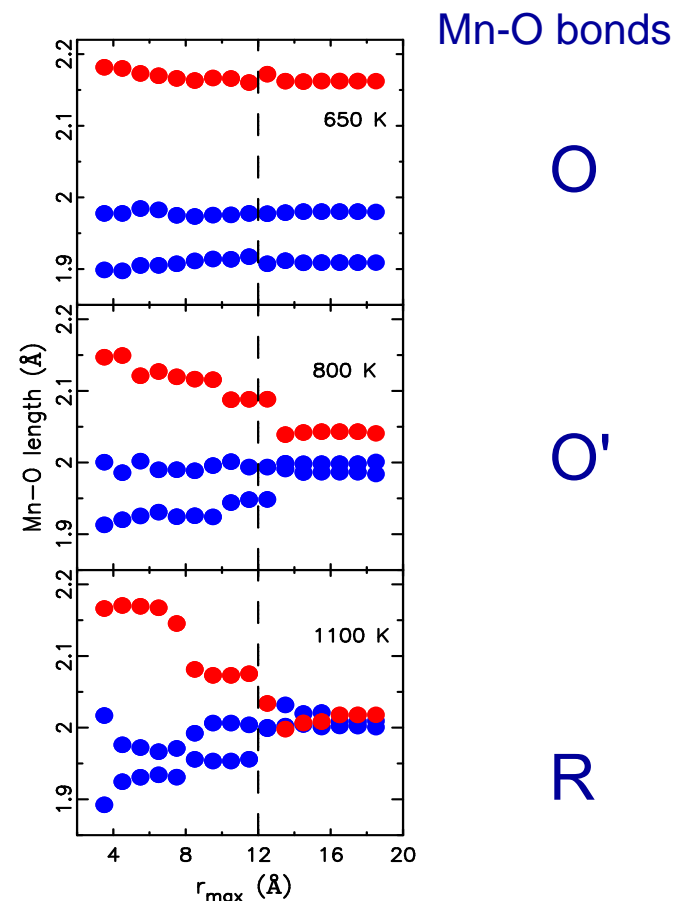

# LaMnO<sub>3</sub>: Jahn-Teller distortion

Local

Average

Intermediate ?

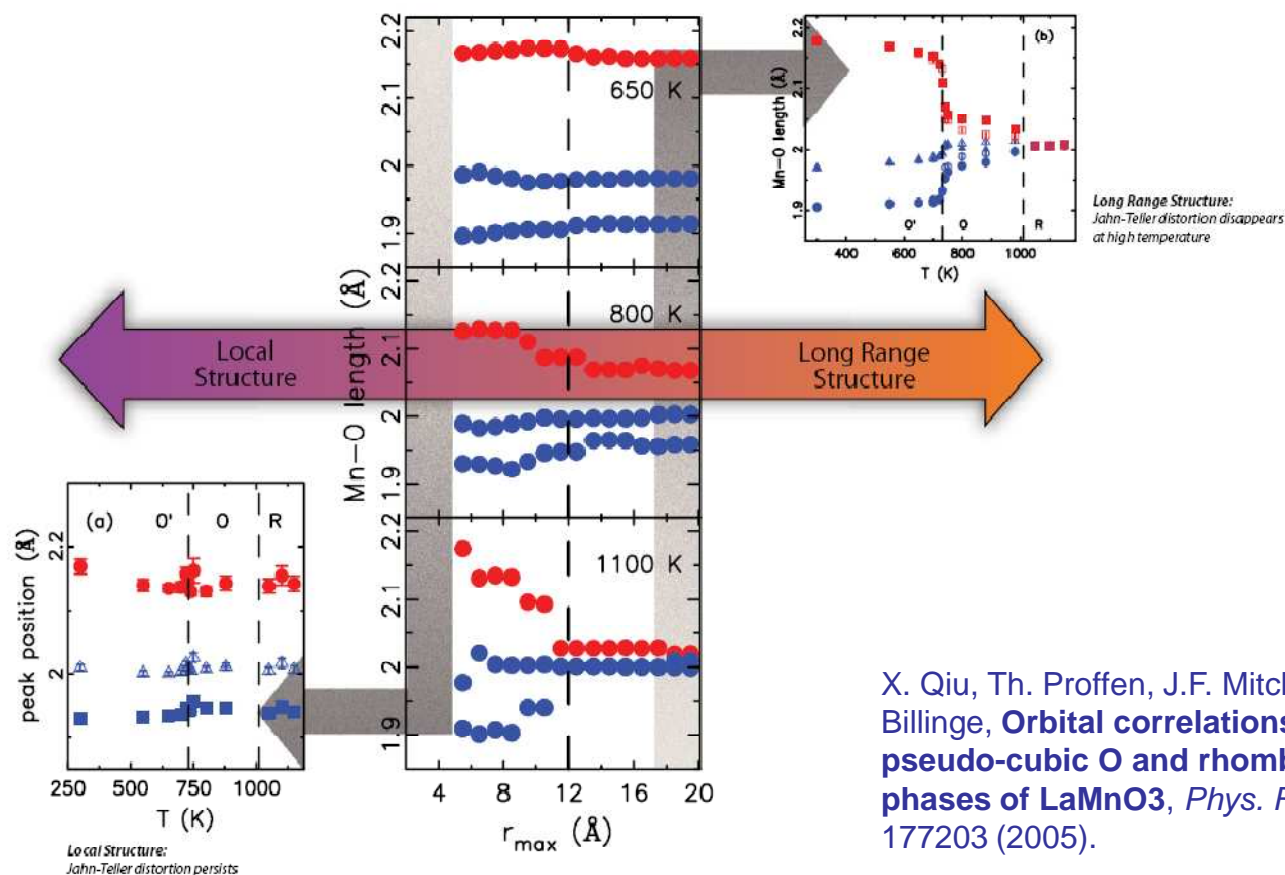

X. Qiu, Th. Proffen, J.F. Mitchell and S.J.L. Billinge, **Orbital correlations in the pseudo-cubic O and rhombohedral R phases of LaMnO<sub>3</sub>**, *Phys. Rev. Lett.* **94**, 177203 (2005).

# Refinement range – the mystery of $\text{LaMnO}_3$

## DISTORTED OR NOT DISTORTED?

Study of the Jahn-Teller distortion in  $\text{LaMnO}_3$

X. Qiu, Th. Proffen, J.F. Mitchell and S.J.L. Billinge, **Orbital correlations in the pseudo-cubic O and rhombohedral R phases of  $\text{LaMnO}_3$** , *Phys. Rev. Lett.* **94**, 177203 (2005).

# “Complete” Structure of Gold Nanoparticles

Katharine Page

Thomas Proffen

Ram Seshadri  
Tony Cheetham

**Facilities:** Lujan  
**Funding:** DOE, NASA

UNCLASSIFIED

## Example: Gold nanoparticles

- Nanoparticles often show different properties compared to the bulk.
- Difficult to study via Bragg diffraction (broadening of peaks).
- PDF reveals “complete” structural picture – core and surface.
- This study:
  - 5nm monodisperse Au nanoparticles
  - 1.5 grams of material
  - Neutron measurements on NPDF

UNCLASSIFIED

## Au nanoparticles: Particle size

## Au nanoparticles: Particle size

R.C. Howell, Th. Proffen and S.D. Conradson, **The pair distribution function and structure factor of spherical particles**, *Phys. Rev. B* **73**, 094107 (2006).

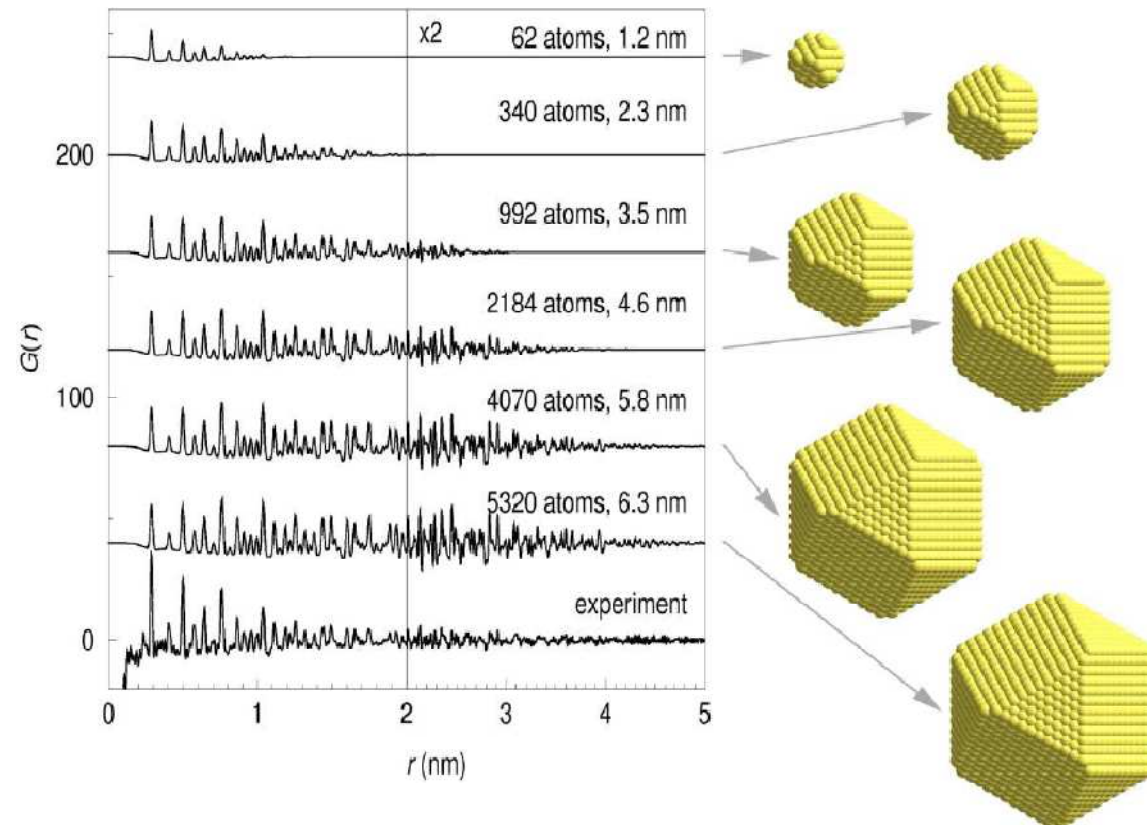

# Au nanoparticles : Structural refinements

- PDF from nano- and bulk gold refined using PDFFIT.
- Nanoparticles show “normal” gold structure.
- No indication of surface relaxations.
- $a_{\text{bulk}} < a_{\text{nano}}$
- Indication of Au-cap distances

K.L. Page, Th. Proffen, H. Terrones, M. Terrones, L. Lee, Y. Yang, S. Stemmer, R. Seshadri and A.K. Cheetham, **Direct Observation of the Structure of Gold Nanoparticles by Total Scattering Powder Neutron Diffraction**, *Chem. Phys. Lett.* **393**, 385-388 (2004).

## Au nanoparticles: Particle size

We're dealing with a length scale that can be simulated on an atom by atom basis, perhaps opening the door to extremely detailed refinements.

# Nano-structured transition metal carbides

**Katharine Page**  
*(PhD work)*

**Ram Seshadri**  
**Tony Cheetham**

**Thomas Proffen**

**Facilities: Lujan**

UNCLASSIFIED

## Nanostructures transition metal carbides

Catalytic activity of platinum group metals with greater thermal stability and resistance to poisoning.

Nanostructured Mo and W carbide will provide higher surface area than traditionally prepared materials.

Prepared by treating molybdates/tungstates in a quartz tube with flowing 50%-H<sub>2</sub>/CH<sub>4</sub> at 10 mL/min at elevated temperatures.

## NPDF measurements

XPS studies suggest there is a significant contribution of non-carbide carbon. *It is known that graphitic carbon can block almost all of the active surface.*

The difference curve, fit with the graphite structure.

## Summary and more information

- Analysis of total scattering gives valuable insight in **structure**  $\leftrightarrow$  **properties relationship**
- **High-resolution instruments** open the door to **medium-range order** investigations
- Obtain structural information from disordered crystalline, amorphous or composite materials
- Fast powder measurements allow systematic exploration of local structure as function of  $T$ ,  $x$ ,  $P$
